

Initiatives for the quarter

Summer prospecting at TT8 is now complete

Four high-grade showings discovered at TT8

TT8 drilling to commence in October

Infill drilling underway, two rigs active

Exploration Activities Currently Underway

TT8 Zone

Style of Mineralization

- Sedimentary and mafic tuffs hosted biotite schist vein hosting pyrite, pyrrhotite and at times chalcopyrite
- Current work has exposed the vein between 5 cm to over 1 m in width
- Surface prospecting has returned several high-grade samples

Why This Area Is Believed To Have Potential

- Interpreted as a potential extension to the Kabi greenstone belt to the west, and exploration potential could be significant
- Summer prospecting has extended the potential of the overall mineralized extent 2.5 km to the northeast
- Several high-priority targets have been identified for follow-up

Exploration Work Completed

- 1,800 m drilled across 14 holes to-date
- Summer surface prospecting completed
- Geophysics underway
- Drilling is expected to commence in late October

TT8 Area Explored

Selected Drill Results at TT8

Hole	From (m)	To (m)	Width (m)	Grade (g/t Au)
TT8-20-01	11.27	12.45	1.18	11.14
TT8-20-03	16.48	17.48	1.00	4.98
TT8-20-05	10.45	12.00	1.55	4.31
TT8-20-06	23.32	24.00	0.68	33.1
TT8-20-08	42.90	43.37	0.47	29.5
TT8-20-10	27.32	27.83	0.51	12.5
TT8-20-11	69.73	70.18	0.45	3.45
TT8-20-15	40.95	41.38	0.43	15.4

Core intersection lengths approximate 80% true width, assay results are uncut, fire assay with metallic screen on samples > 10 g/t

Infill Drilling

What is the purpose of this drilling?

- Grade control drilling: to de-risk the plan and better define geometry of the ore body
- Convert Inferred Resources to the Indicated Category and potentially extending mine life

How many rigs are active?

- Two rigs are active, one underground and one at surface

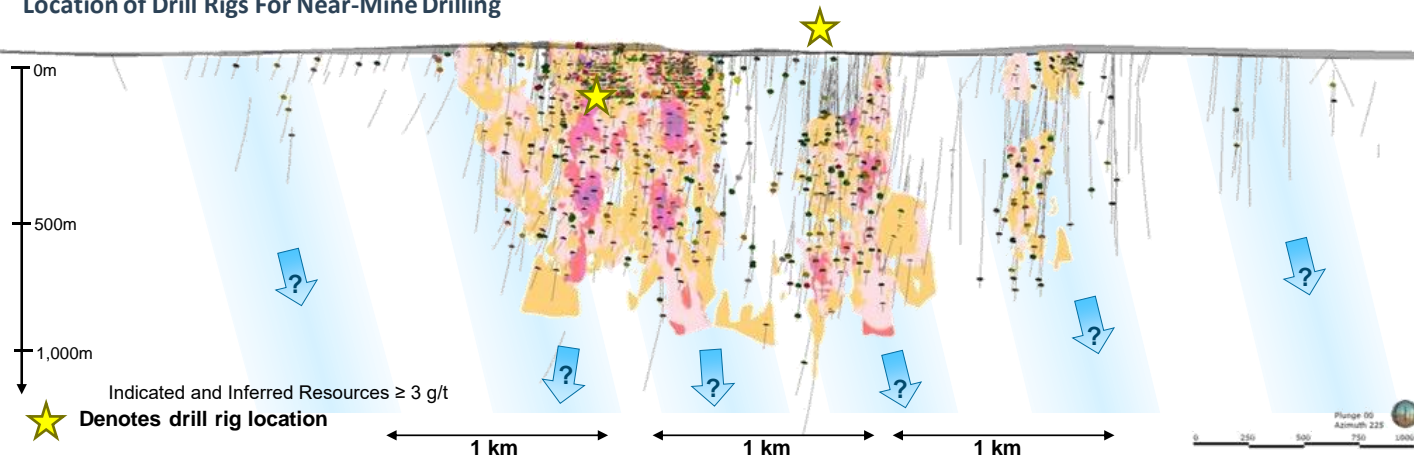

How much drilling has been completed to-date?

- 15 holes totaling 2,600 m. Harte Gold has budgeted 16,000 m of ore definition and extension drilling for this year

For further information
